Managing disinfection within an advanced CCS.

Annex 1 indicates clear requirements for Cleaning and Disinfection which are key elements included in the Contamination Control Strategy (CCS) as a holistic and mandatory process for the manufacture of sterile products.

Based on the process understanding, appropriate risks assessment and mitigation measures should be applied considering potential impact on the quality of the final sterile product with the final goal to create a specific quality assurance-approved disinfection and monitoring program able to ensure the required compliance.

Materials utilized for the construction of the room and for items used within the cleanroom, should be selected to minimize particle generation and to allow the suitable use of the cleaning and disinfectant agents.

Several case studies will describe practical solutions for: glove management and materials handling, cleaning, sanitizing agents, disinfectants evaluation, materials compatibility, and frequency program and sanitization technologies.
